## **FOREWORD**

The Department of archaeology of the Avataq Cultural Institute financed the 2005 fieldwork in Salluit. Thus, this project had a very limited budget and could not have been a success without the enthusiastic help of the Salluit community and the financial help of KRG in the employment of youth students (summer employment program in Salluit). We would like to express our gratitude to the Mayor and the team at the Municipality and to the Qaqqalik Landholding Corporation for their support since the project started in 2001.

This fieldwork could not have been completed without the professional involvement of Elisapie and Mosusie Naluiyuk who provided a comfortable camp and a secure working environment. Many tenacious young students from Salluit participated in the excavation this year: Siasie Kaitak, Calai Kuananack, Eva Eetuk, Evie Amaamatuak, Timingiak Cameron, Eva Eetuk, Mark Kakayuk, Stas Ikey, Ulaayu Ninigiurluut, Akisuk Naluiyuk and Dalasia Atagutaaluk. We thank them for their continued vivacity, enthusiasm and interest in learning and promoting archaeology over the years.

This work was done with the authorization of Nunavut, **permit: 05-026A**. We thank the Department of Culture, Language, Elders and Youth for the rapid delivery of the permit after our request was received late.

---

## **Background to this Research**

The Tayara site (KbFk-7) was first discovered by William Taylor in 1957 and then excavated in 1958 (Taylor 1968). Taylor named the site in honour of his Inuit guide: Tayara (see front page photo). The excavation took place during ten short days and was nearly impossible to achieve with the frozen soils of mid-September. However, six trenches were excavated, revealing three archaeological layers.

In 2000, we submitted a 3-year project to the Social Sciences and Humanities Research Council of Canada (SSHRC) that included the entire history of the southern Hudson Strait coast between Quaqtak and Salluit. This project, which comprised archaeological, historical and geomorphological research between the 3 villages, was accepted for the 2001 to 2003 period. The aim of the program was to encourage research in social sciences, but more importantly, to facilitate community involvement and to train students in various disciplines involved in this research project (Avataq Cultural Institute 2002: 2).

The project began in summer 2001 and was thus a well-suited occasion to go back to the KbFk-7 site more than 40 years after Taylor. The Tayara site (KbFk-7, coordinates: 621637N, 753312W) is located on the south part and in the main valley of Qikirtaq. The island itself is situated at the entrance of the Salluit fjord, not far from the locality of Salluit in the Nunavik part of Hudson Strait. This small island is both a good camping area as well as an advantageous area for hunting; Ford channel is rich in sea resources (belugas, seals, fish and, until the

1950s, walrus) which is perhaps why the people of Salluit have continued to occupy this island where many of the elders were born.

The site lies at about 18 m above sea level within a wide valley (see Figure 1 and Figure 2) and covers a large area of about 200 m long by 50 m large, between 110 m and 200 m from seashore. The site is split into three parts by two small watercourses stemming from melting snow above and below ground during summer. Taylor's excavation, for the most part, remained in the central portion of the site, but he also explored the north and south portions by digging three trenches.

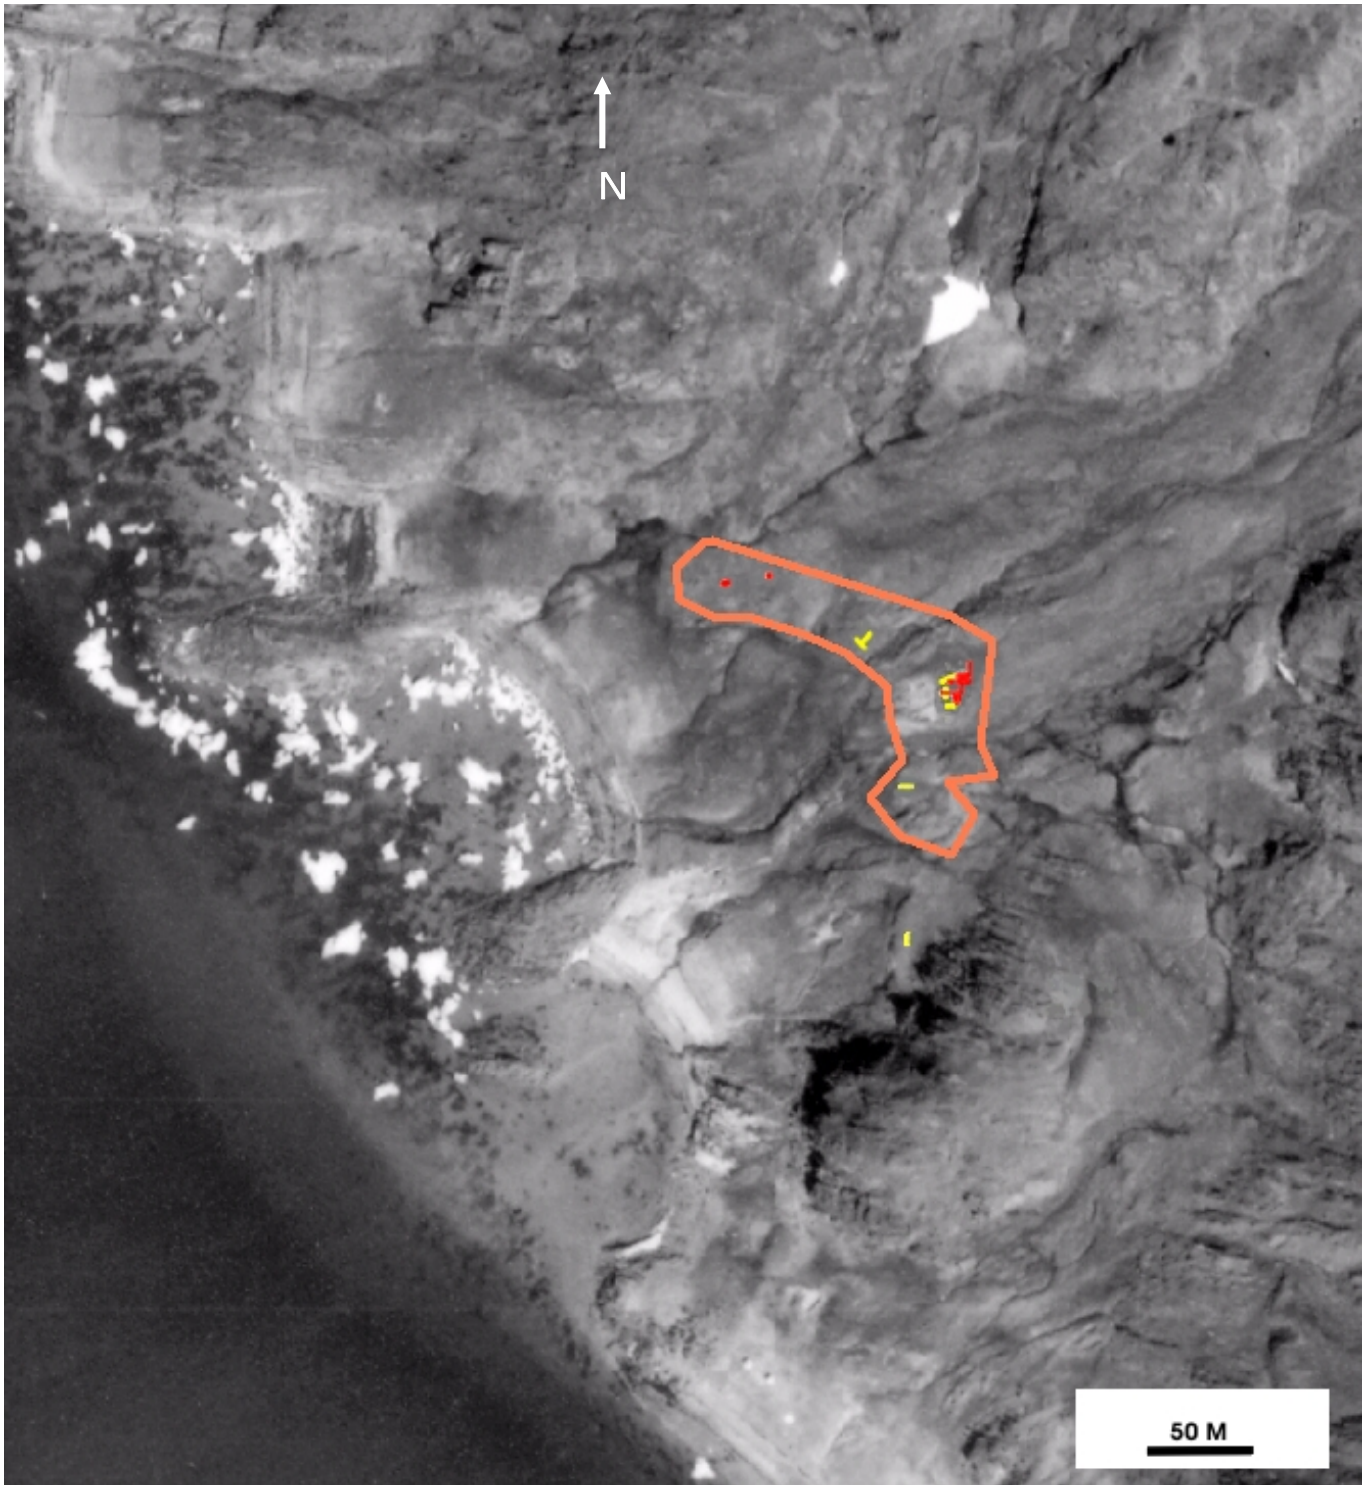

The central portion of the site is slowly being eroded away, leaving numerous artifacts on the surface of the eroding palaeobeach front. This phenomenon permitted the discovery of the site in the 1950s. Examination of old photographs and air photos confirmed that these erosion zones were already present and active at that time. Because of this erosion, we decided to concentrate the work on this area of the site during the 2001, 2002 and 2003 seasons.

In 2003 we left the Tayara site after having faced a week-long windstorm that did not allow us to finish the excavation of the second archaeological level opened in the central portion of the site. This year we wanted to finish the excavation of this level started in 2003, and to open a few squares in the level III as well as to open test pit in new areas.

**FIGURE 1: Qikirtaq, localization of the KbFk-7 site (1:20000)**

**FIGURE 2: Location of the KbFk-7 site, limits of the site (orange), Taylor's trenches (yellow) and new excavation area (red) (The sand deflation is visible just west of the central excavation area)**

## **2005 FIELDWORK**

### **Summary of Fieldwork Activities**

The site was excavated during a short period because we had a limited budget. We left Montreal on July 14<sup>th</sup> and for different reasons (fog, strong wind...) we were not able to go on the island until July 17<sup>th</sup> and finally rain prevented us from working with the excavation team on the Tayara site (KbFk-7) until July 19<sup>th</sup>. The site had been covered with plastic tarps and the holes were filled at the end of the fieldwork season in 2003. Two years later everything had stayed in good condition, especially the wall profile protected with plywood (Figure 3).

**FIGURE 3: Site as it was when we arrived in mid-July 2005, view toward southwest**

Until the beginning of August we worked to finish the excavation of what remained of the level II from the 2003 excavation (figure 4). As we were expecting we discovered *in situ* many new artifacts, bones and charcoal samples in a good state of preservation (Figure 5). Among others, we also discover a nice walrus carving (Figure 6). After that we were able to do a general cleanup of all zones excavated during previous years. This permitted us to have a general view of the structure and to take numerous pictures to complement the map of the structures (Figure 7, Figure 8 and Figure 9). With the rest of the pictures, a little more than a dozen pictures were taken to document the excavation directly classified in the computer each evening.

**FIGURE 4: Excavation of level II**

**FIGURE 5: Seal flipper *in situ***

**FIGURE 6: Walrus carving *in situ***

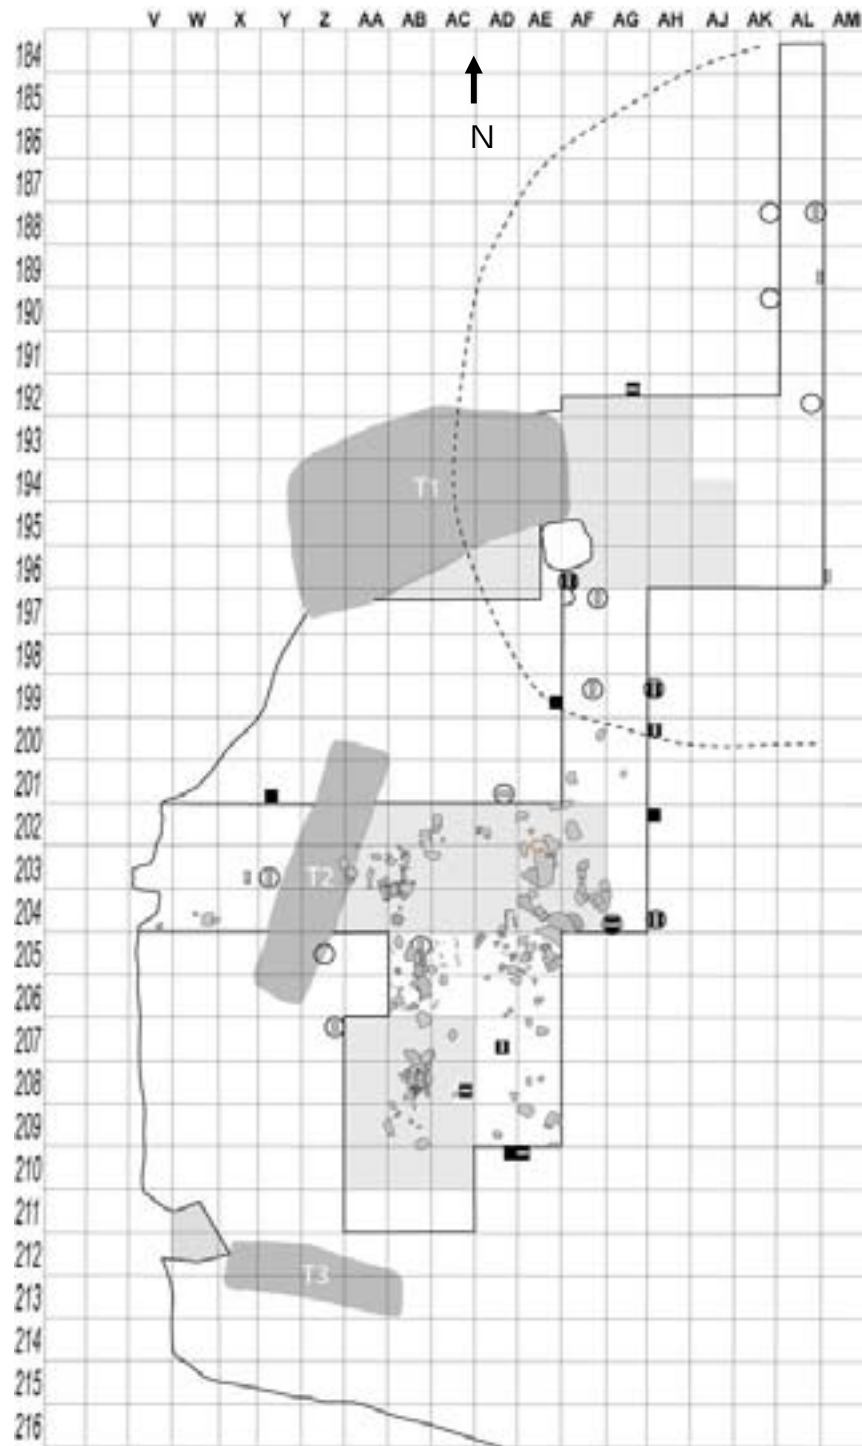

**FIGURE 7: Structures of Tayara level II, view toward the south.**

**FIGURE 8: Drawing of the structures**

**FIGURE 9: Site map, Taylor's trenches (dark grey and numbered T1, T2, T3), 2002 excavation (pale grey), 2003 and 2005 excavation of level II (white) except for squares AL-AK 196-184 representing zones with no archaeological layer, symbols refer to soil samples collected for geomorphological analysis (Scale: 1 metre the square side)**

We started the excavation of level III with the main objective of finding characteristic material to document this occupation. We excavated around 6 square meters (Figure 10). We found bones and sparse lithic artifacts but nothing really characteristic. No clear evidence of structure was found but a few small stones may indicate their presence. Bone is in a different state of preservation than in level II: it is more fossilized. A good demarcation exists between the two layers and we were pleased to find they apparently have not been mixed even if they are sometimes separated by a sterile layer less than 10 cm thick.

**FFIGURE 10: Excavated part of level III, view toward south.**

We also excavated during weekends a test pit near Taylor's trench number 6. The excavation yielded a large quantity of bone and also many lithic artifacts showing the good remaining potential in the north area of the site however the stratigraphy is more difficult to understand (Figure 11). Our work permitted us to identify two layers that are maybe representing a single layer. We had no time to go deeper to identify other levels but compared with Taylor's work this is to be expected (Figures 12 and 13).

**FIGURE 11: Wall profile of the test pit, view toward north.**

**FIGURE 12: General view of the test pit and of the ancient Taylor's trench number 6, view toward northeast.**

**FIGURE 13: Mosusie helping us during weekend excavation**

The site was closed with plastic tarps covered almost completely by sand, filling the hole of the excavation (Figure 14). Finally we left the site around the 10<sup>th</sup> of August without having time to visit the Toonoo site as it was initially planned when we applied for the archaeological permit.

**FIGURE 14: Closing the site, view toward north**

## **Fieldwork Methods**

Field method use was identical to the previous fieldworks on the site (c.f. Avataq Cultural Institute 2003 and 2004). All sediments from the archaeological layers was water sieved (Figure 15). As usual we also had a field laboratory where artifacts were first treated and packed and water sieving residues were sorted (Figure 16). The fragility of certain bones required the use of pH Neutral PVA Adhesive to extract them properly (Figure 17).

**FIGURE 15: Water sieving**

**FIGURE 16: Field laboratory**

**FIGURE 17: Treating fragile bones**

## **Analyses Progress**

A whole team of researchers and students are working on the Tayara site. In particular, Dominique Todisco is doing a Ph.D. on the geoarchaeology of the site and the geomorphology of the Tayara valley. Hervé Monchot started studying the zooarchaeology of the site as a post-doctorate fellow and Claire Houmard has recently started a Ph.D. on bone and ivory technology including Tayara artefacts. Pierre M. Desrosiers is continuing his Ph.D. on Dorset lithic technology including the collection of the level II of Tayara. Also recently a research on raw material sourcing has just started including the lithic collection of Tayara. This will be lead by Desrosiers and Adrian Burke (Université de Montréal). Other members of the team including Daniel Gendron, Noura Rahmani and Najat Bhiry intend to participate to other type of analysis. In the long process of spatial analysis of all elements present on the site, lithic refitting is also planned.

## **CONCLUSION**

The 2005 field season permitted us to conclude the excavation of a portion of the level II of the Tayara site (KbFk-7). To have a better idea of the structural evidence we must excavate more of the level II, but one of the preliminary hypotheses is that we are possibly excavating a Dorset longhouse.

Excavation of level III is inconclusive in the absence of characteristic artifacts but we suspect from Taylor's collection that the level is associated with a Groswater-like or late Pre-Dorset culture. More excavation is needed on this level. Long years of study and analyses are to be planned before we can have a clear idea. In the next two years we expect the first results in lithic technology, geoarchaeology and zooarchaeology.

The Tayara site is an exceptional place attesting to the rich heritage of the Salluit community. Over the years many youth students and Inuit teachers have been involved in this project. Local authorities and the population have showed great interest in this work and we hope they will have chance to acquire a local museum where the exceptional collection of Tayara site can be exhibited in the future.
